

CASE 2

On the event date 10 week old male child two days after surgery for an unrelated condition became unresponsive while being cared for by his father. 911 called and at ER a CT without contrast indicated extraaxial blood without mass effect in the right frontoparietal convexity, left temporal and lower parietal region consistent with subarachnoid hemorrhage. Ophthalmologic examination revealed bilateral retinal bleeding describes a severe. Full body scan revealed rib areas described as old healing rib fractures. Prior x-rays described these same ribs as "rib deformities."

Outcome: Pending
